Mise en ligne le 20/06/2012

Summary: A key to the non-lichenicolous *Capronia* species is presented and *Capronia holmiorum* is proposed as a *nomen novum* to replace *Capronia collapsa* (K. Holm & L. Holm) O.E. Erikss. *nom. illeg.* Several names placed in the genera *Berlesiella*, *Capronia*, *Dictyotrichiella* and *Herpotrichiella* are discussed at the end of the key.

Keywords: Ascomycota, Chaetothyriales, Herpotrichiellaceae, key, *nomen novum*.

Zusammenfassung: Ein Schlüssel zu den nicht-lichenicolen Arten der Gattung *Capronia* wird präsentiert. *Capronia holmiorum* wird als *nomen novum* vorgeschlagen um *Capronia collapsa* (K. Holm & L. Holm) O.E. Erikss. *nom. illeg.* zu ersetzen. Einige Namen der Gattungen *Berlesiella*, *Capronia*, *Dictyotrichiella* und *Herpotrichiella* werden am Ende des Schlüssels diskutiert.

Schlüsselwörter: Ascomycota, Chaetothyriales, Herpotrichiellaceae, Schlüssel, *nomen novum*.

Introduction

The genus *Capronia* Sacc. is characterized by typically small, dark and setose ascomata, fissitunicate, 8- to polysporous asci, septate ascospores and the absence of interascal filaments (BARR, 1991; MÜLLER et al., 1987; RÉBLOVÁ, 1996). *Capronia* species are surprisingly little studied by amateur mycologists, even though almost 70 described species are known. One of the reasons why such little attention is paid to *Capronia* species might be the difficulty of finding them. Some species are common on rotten wood, old fungi or other organic material, yet easily overlooked due to their typically small and inconspicuous ascomata.

Possibly the most important reason why *Capronia* species tend to be avoided by mycologists, however, might be the lack of a comprehensive treatment of the genus. Although there are two papers containing keys to a number of species (BARR, 1991; MÜLLER et al., 1987), several problems with identification remain. Both keys contain different species and the outcome often varies depending on which key is used. Furthermore, several species have been described or combined to *Capronia* during the last twenty years and the knowledge of species has increased.

The aim of the present paper is to provide a help for mycologists to determine collections of *Capronia* based on teleomorphic characteristics. However, many species are known only from a single or very few collections (UNTEREINER et al., 2011) and morphological features are known to vary to a certain extent (UNTEREINER, 2000). It is therefore often difficult to separate species properly by using only teleomorphic characteristics. Thus, it is important to understand that the key is intended as an initial help for determination and that

Ascomata of a *Capronia* species

it is necessary to consult the given literature for more detailed information.

For important remarks on the genus *Capronia* – concerning the significance of morphological and molecular characteristics used for taxonomy – see UNTEREINER (2000).

The key is based on all *Capronia* species listed in *Index Fungorum* and *Mycobank* databases, but excludes lichenicolous species. A key to the lichenicolous taxa is provided by HALICI et al. (2010). Important data on species which the author has not yet examined are taken from the cited literature (see also the note at the beginning of the key below).

An often overlooked characteristic of *Capronia* species is the reaction of the ascal gel to IKI (Lugol's solution) (WINKA et al.,

1998; UNTEREINER, 2000). This reaction is rather unknown due to the usage of Melzer's reagent instead of IKI and appears to be consistent in several species (BARAL, pers. comm.). Consequently, the reaction to IKI should be tested in future studies of the genus.

Compared to other genera of the Ascomycota, it is quite likely to find *Capronia* species which do not fit to any descriptions of the known taxa. Such unidentified collections are not mentioned here because including them would result in a considerably larger and less user-friendly key. Furthermore, several collections need to be recollected and examined with different methods to affirm that they are truly independent species. It would therefore be premature to include them here.

Key

The information indicated by the symbols used in the key is based on all the literature the author was able to consult (not only the references cited in the key) and personal experience.

- The author examined at least one collection of this species.
- (◦) The author has studied this species only based on collections whose identification remained doubtful.
- This species is known surely only from the type collection or less than three collections by the type author.
- ⌘ Growing on herbaceous substrate or leaves.
- ★ Growing on lignicolous substrate (including woody dwarf shrubs, excluding Ericaceae)
- ◇ Growing on Ericaceae.
- ▼ Fungicolous species.
- ◆ Graminiculous species.
- This species has been described from cultures *in vitro*.
- ? A question mark after one of the above mentioned symbols indicates that the information is uncertain.
- [] Brackets around one of the above mentioned symbols indicate that the information applies only to some collections of this species.

- 1 Asci 32-spored 2
 1* Asci (3)8- to (8)16-spored 4

<i>Capronia semi-immersa</i> (Cand. & Sulmont) Unter. & F.A. Naveau, <i>Mycologia</i> , 91(1): 73 (1999) (as "semiimmersa")	
Basionym: <i>Dictyotrichiella semi-immersa</i> Cand. & Sulmont, <i>Revue de mycologie</i> , 36: 242 (1971) (as "semiimmersa")	
= <i>Capronia svrcekiana</i> Réblová, <i>Czech Mycology</i> , 49(2): 82 (1996)	
Notes: For illustrations see the references given by UNTEREINER et al. (2008). These references also include descriptions of this species.	
UNTEREINER et al. (2008) conclude that <i>C. svrcekiana</i> has to be considered a synonym of <i>C. semi-immersa</i> .	
<i>Pleosphaeria patagonica</i> is similar to <i>C. semi-immersa</i> in several aspects. CANDOUSSAU & SULMONT (1971) argue that <i>P. patagonica</i> differs from <i>C. semi-immersa</i> in superficial ascomata, septate hairs, ascospores with four transversal septa and a different host. However, the position of the ascomata of <i>C. semi-immersa</i> on the substrate is known to vary (UNTEREINER & NAVEAU, 1999) and also the septation of the setae is a characteristic which may vary to a certain extent. Furthermore, SPEGAZZINI (1887) gives 3–5 transversal septa of the ascospores in the protologue of <i>P. patagonica</i> and not 4 septa as mentioned by Candoussau & Sulmont (who also give 3–5 transversal septa for <i>D. semi-immersa</i>). Unfortunately, the type of <i>P. patagonica</i> seems to be lost according to Candoussau & Sulmont. <i>Pleosphaeria patagonica</i> f. <i>salicis</i> , described from France, is similar to f. <i>patagonica</i> except for slightly smaller ascospores with 3, rarely 4 transverse septa.

- 43*** Ascospores (10)15–27.5 µm long *C. borealis* °◆★
Capronia borealis M.E. Barr, *Mycotaxon*, 41(2): 424 (1991)
 Bibl.: BARR (1991: 424 f.), RÉBLOVÁ & SVRČEK (1997: 211)
 III.: BARR (1991: fig. 5–6), RÉBLOVÁ & SVRČEK (1997: fig. 2 g, 4–5), BARR & HUHDORF (2001: fig. 39–42)
 Notes: BARR (1972) mentions two collections of *C. fusispora* on *Cassiope* with 5–7 septate ascospores measuring 22–33 × 4.5–5.5 µm. According to BARR (1991), these two collections are separable from *C. fusispora* and she describes them as *C. borealis*. However, the ascospores are given as (10)15–27.5 × (3.5)4.5–6 µm in the protologue, thus considerably shorter than mentioned by BARR in 1972. See also the notes under *C. fusispora* (42%).
C. brabeji •★ is described from twig litter of *Brabejum stellatifolium* and possesses slender ascospores. It is doubtful, however, that this species belongs to *Capronia* since

- pseudoparaphyses are mentioned and illustrated in the protologue.
- Capronia brabeji* Marincowitz, M.J. Wingf. & Crous, *Microfungi occurring on the Proteaceae in the fynbos*: 28 (2008)
Bibl.: MARINCOWITZ et al. (2008: 28)
III.: MARINCOWITZ et al. (2008: fig. 12)
- 44** (38*) Growing on other fungi 45
 Note: Lignicolous *Capronia* species are often closely accompanied by other fungi and in some cases it is difficult to decide whether the species are rather lignicolous or fungicolous. In doubtful cases, one should try both possibilities (45 and 48).
- 44*** Substrate different 48
- 45** Growing on the hymenium of Basidiomycota 46

 Bibl.: ELLIS & EVERHART (1890: 240), BARR (1972: 615)
 III.: BARR (1972: fig. 148–150), BARR (1987: pl. 10 G), MÜLLER et al. (1987: fig. 1 A, 4 F)
- 47*** Ascospores ovoid, with obtuse ends
 *C. commonsii* ▼
Capronia commonsii (Ellis & Everh.) M.E. Barr, *Mycotaxon*, 41(2): 424 (1991)
 Basionym: *Melanomma commonsii* Ellis & Everh., *Proceedings of the Academy of Natural Sciences of Philadelphia*, 42: 239 (1895)
 Bibl.: ELLIS & EVERHART (1895: 239 f.)
 III.: BERLESE (1894: tab. XIX 4), BARR (1991: fig. 12–14)
 Notes: In their original description ELLIS & EVERHART (1895) mention “abundant filiform paraphyses”. BARR (1991), who studied at least one collection of *C. commonsii*, does not mention any paraphyses-like elements but, on the other hand, gives no full description of this species. As pointed out by UNTEREINER (2000), germinating ascospores or the remnants of discharged asci of *Capronia* species might resemble pseudoparaphyses. Thus, and since interascal hyphae are lacking in the genus *Capronia*, *C. commonsii* either does not possess (pseudo)paraphyses despite the original description or might not be true *Capronia*.
- 48** (44*) Ascospores (7)8–10(11) × 3–4 µm
 *C. proteae* ● ★
Capronia proteae Marincowitz, M.J. Wingf. & Crous, *Microfungi occurring on the Proteaceae in the fynbos*: 32 (2008)

 Basionym: *Herpotrichiella setosa* M.E. Barr, *Contributions de l’Institut Botanique de l’Université de Montréal*, 73: 30 (1959)
 Bibl.: BARR (1959: 30)
 III.: BARR (1959: fig. 44–47)
- 49*** Lignicolous (typically; several possibly closely related species on other substrates are mentioned underneath), ascospores shorter *C. pilosella* ° ★
Capronia pilosella (P. Karst.) E. Müll., Petrini, P.J. Fisher, Samuels & Rossman, *Transactions of the British Mycological Society*, 88(1): 67 (1987)
 For synonyms see UNTEREINER (1997).
 Bibl.: MUNK (1957: 438 f.), BARR (1972: 615 f.), DENNIS (1981: Add. 32 f.), SPOONER (1981: 269 ff.), LARIOS et al. (1988: 94 f.), ELLIS & ELLIS (1997: 29), UNTEREINER (1997: 124 ff.), SIERRA LÓPEZ (2006: 75 f.)
 III.: BERLESE (1894: tab. XXVI 3), MUNK (1957: fig. 182), SPOONER (1981: fig. 6), DENNIS (1981: fig. 35 V), LARIOS et al. (1988: fig. 1, H–J), ELLIS & ELLIS (1997: fig. 107), UNTEREINER (1997: fig. 14–26), SIERRA LÓPEZ (2006: fig. 1)
 Notes: *C. moravica* (Petr.) E. Müll., Petrini, P.J. Fisher, Samuels & Rossman is considered a synonym of *C. pilosella* (UNTEREINER, 1997).
 For illustrations of *C. moravica* see the references given by UNTEREINER (1995).
C. pilosella var. *longiseta* was described by NOGRASEK (1990) with longer setae (50–100 µm) and longer ascospores and asci. A collection mentioned by HOLM & HOLM (1977) with 15–75 µm long setae might resemble *C. pilosella* var. *longiseta* but the size of the ascospores is in the normal range of *C. pilosella* var. *pilosella*.
Capronia pilosella var. *longiseta* Nogrsek, *Bibliotheca Mycologica*, 133: 104 (1990)
 Bibl.: NOGRASEK (1990: 104)
 III.: NOGRASEK (1990: Abb. 34)
 BERLESE (1894) gives descriptions of several *Chaetomastia* species which show some resemblance to *C. pilosella*. *Ch. hispidula* (Sacc.) Berl. is said to possess shorter but wider asci and slightly bigger 3-, rarely 5-septate or even muriform ascospores. *Ch. hirtula* (P. Karst.) Berl. is described with 4-(6-) spored asci measuring 90–100 × 12 µm and bigger ascospores (20–22 × 6–7 µm). The ascospore size of *Ch. canescens* (Speg.) Berl. is given as 20–25 × 10 µm and *Ch. juniperina* (P. Karst.) Berl. also possesses bigger ascospores (16–22 × 5–7 µm; with 5 transverse septa) than *C. pilosella*.
C. collapsa ★♦ is said to differ from *C. pilosella* in bigger (up to 240(385) µm diameter) and collabent ascomata (MATHIASSEN, 1989, 1993; BARR, 1991). However, in *C. pilosella* the size of the ascomata varies considerably (for example MUNK (1957) gives 80–230 µm diameter while LARIOS et al. (1988) give only 100–125 µm diameter). Moreover, BARR (1991) mentions a collection of *C. collapsa* with “small collabent ascomata, 90–100 × 60–70 µm”, so the collapsing ascomata seem to be the only separating characteristic. Thus, ERIKSSON (2009) synthesizes *C. collapsa* with *C. pilosella*.
Capronia collapsa (Math.) M.E. Barr, *Mycotaxon*, 41(2): 427 (1991)

Basionym: *Herpotrichiella collapsa* Math., *Sommerfeltia*, 9: 51 (1989)
 Bibl.: MATHIASSEN (1989: 51 ff.; 1993: 74 f.), BARR (1991: 427)
 III.: MATHIASSEN (1989: fig. 37, 39, 41–44; 1993: fig. 23–25, 102 A–F, 104, 113), BARR (1991: fig. 9–11)
Herpotrichiella papuapteridis (described from *Papuapteris linearis*), *H. callunae* (described from *Calluna vulgaris*) and *H. martyniae* (described from *Martynia indica*) seem very close to *C. pilosella* except for their different ecology.
Herpotrichiella papuapteridis Otani, *Bulletin of the National Science Museum, Tokyo*, 14(3): 487 (1971)
 Bibl.: KOBAYASI (1971: 487 f.)
 III.: KOBAYASI (1971: fig. 54 e–h)
Herpotrichiella callunae RICHTEANU, *Revue Roumaine de Biologie*, 33(1): 8 (1988)
 Bibl.: RICHTEANU (1988: 8 f.)
 III.: RICHTEANU (1988: fig. 1–3)
Herpotrichiella martyniae R. Rao, *Maharashtra Vidnyan Mandir, Patrika*, 7(1–2): 63 (1972)
 Bibl.: PANDE (2008: 25)
 Notes: Information on this species was taken from the description by PANDE (*loc. cit.*).
 The original description of the teleomorphic state of *C. coronata*, described from New Zealand, is nearly identical with *C. pilosella*. It seems likely that these species cannot be distinguished without cultural studies.

Notes on some names published in the genera *Berlesia*, *Capronia*, *Dictyotrichiella* and *Herpotrichiella*

The genera *Berlesia* Sacc., *Dictyotrichiella* Munk and *Herpotrichiella* Petrak, amongst others, have been synonymized with *Capronia* by MÜLLER et al. (1987). Some of the following names published in these genera, however, do not belong to *Capronia* or are at least of doubtful position.

Berlesia hispida Morgan: According to the original description (MORGAN, 1903), this species possesses paraphyses (“the paraphyses very slender”) and “at first hyaline, at length yellow-brown” ascospores which have a colour “not different from that in some species of *Cucurbitaria*”. Therefore, this species presumably does not belong to the *Herpotrichiellaceae*.

Berlesia parasitica (Fabre) Höhn. ≡ *Pachythrygium parasiticum* (Fabre) G. Arnaud ex Spooner & P.M. Kirk

Capronia constricta (Bres.) Berl.: This taxon is hardly known and quite ambiguous. BRESADOLA (1890) described *Metasphaeria constricta* with 8-spored asci measuring 80–100 × 14–16 µm and with ascospores measuring 15–30 × 6–8 µm with 3–7 longitudinal septa plus one transverse septum. BERLESE (1900), who apparently examined Bresadola’s type specimen, moved *M. constricta* to the genus *Capronia* and redescribed this species with 16-spored asci measuring 75–85 × 12–16 µm and with ascospores measuring 16–21 × 8–9 µm with 4 transverse septa and 1–2 cells with a longitudinal septum. The type specimen should be examined once again to clarify whether this species truly belongs to *Capronia*.

Capronia hanliniana U. Braun & Feiler ≡ *Caproventuria hanliniana* (U. Braun & Feiler) U. Braun

Capronia hystrioides Dugan, R.G. Roberts & Hanlin ≡ *Venturia hystrioides* (Dugan, R.G. Roberts & Hanlin) Crous & U. Braun

Capronia longonigra (Norm.) Aguirre: This species was originally described as *Leptoraphis longonigra* Norm. (NORMAN, 1884) and is said to possess a thallus, big ascomata (300–400 µm diameter) and paraphyses. Therefore, it

seems unlikely that *C. longonigra* is a true *Capronia* (see also the discussion in AGUIRRE-HUDSON, 1991).

Capronia macrotricha: Several internet databases (eg. PESI portal, NBN Gateway, ZipcodeZoo, etc.) list this name as “*Capronia macrotricha* ined.” but the author was not able to find any further information.

Capronia pinicola Petrini & P.J. Fisher ≡ *Tyrannosorus pinicola* (Petrini & P.J. Fisher) Unter. & Malloch

Dictyotrichiella delicatula (Vestergr.) O.E. Erikss.: Not a member of the *Herpotrichiellaceae*. For discussion of the generic placement see, for example, BARR (1997, 1999).

Herpotrichiella indica Pande & Subramon.: The English and the Latin description given in the protologue of *H. indica* (PANDE, 2008) refer to two different species. The English description refers to a species with paraphyses, big ascocarps (250–312 µm diameter) and big asci (128–153 × 16–22 µm). Paraphyses are also mentioned in the Latin description, which refers to a species with hyaline, one-septate ascospores and smaller asci (95–115 × 18–25.2 µm). It seems unlikely from the descriptions that either of these species belong to the *Herpotrichiellaceae*.

Herpotrichiella longispora Remler ≡ *Acanthostigma longisporum* (Remler) Réblová & M.E. Barr

Taxonomy

Capronia holmiorum Friebes, nom. nov.

Mycobank no. MB800711.

Etymol.: The epithet is given in honor of Kerstin and Lennart Holm who described *Teichospora collapsa* as a type species.

≡ *Capronia collapsa* (K. Holm & L. Holm) O.E. Erikss., *The non-lichenized pyrenomycetes of Sweden*: 7 (1992), nom. illeg. (ICBN, Art. 53.1), non *Capronia collapsa* (Math.) M.E. Barr, *Mycotaxon*, 41(2): 427 (1991).

Basionym: *Teichospora collapsa* K. Holm & L. Holm, *Symbiae Botanicae Upsalienses*, 21(3): 41 (1977).

Bibl.: HOLM & HOLM (1977: 41) (as *Teichospora collapsa*), (?)SIERRA LÓPEZ (2006: 79; as “*Capronia* sp. 1”)

III.: HOLM & HOLM (1977: fig. 5 g, 14 e) (as *Teichospora collapsa*), (?)SIERRA LÓPEZ (2006: fig. 2 a; as “*Capronia* sp. 1”)

Acknowledgements

The author wants to thank Luc Bailly, Hans-Otto Baral, Martin Bemann, Paul Blanz, Wolfgang Dämon, Thomas Læsøe, Hermine Lotz-Winter, Geir Mathiassen, Klaus Siepe, Eric Strittmater and Nicolas Van Vooren for help with literature search, sending of specimens, general remarks concerning the paper and comments on certain species.
